English summary

I've made my placement in CYO in Roubaix. CYO is a service company in web technologies on Lille and Paris since 1996.

I had to work to tow software :

First, I had to increase an internal software coded in php. Named bugtrack, it able CYO's developers and customers to report any bugs on a project. I have add several possibilities like change a bug to another project or send a mail when someone add a comment.

Then, I had to create a new internal software named tracking witch able CYO's developers to make a trace of an important question, problem or notice for a project. I have make the database shema and create it. I have use php language to code this project.

Next, I had to make tow website with a CMS (content management system) called typo3 :

The first website was the Dickson's site witch present their products. It contains a search page, a contact page and a news service.

The next one was an extranet for Papetheque witch is a french papethery group. It contains also a search page, a contact page and a news service. Moreover, it able Papetheque users to be identified and offer us a forum.

In this placement I have learn to code with php language and I have learn to use typo3 to make a managable website easily. I have also learn more about html an css.
